

Our code is located on an open github repository. To download go to:

<https://github.com/JoeLee9981/UndefinedParameter>

Then click on the bottom at the bottom right to 'Download ZIP' – This doesn't require you to even be logged in to download the code.

Next included in this zip folder is a file called QuizZing.yml. This is not included in the github repository because it contains the password to our database. This file should be in the /UndefinedParameter/QuizZing folder. The instructions on how to install includes more information about how to use this file to launch the server.
